<u>conservation</u> . Students will wr water conservation over the ne draft about one conservation n over the week. The paper will e	nethod, and will research more and with a description of steps	before completing the assignment at a
<u>conservation</u> . Students will wr water conservation over the ne draft about one conservation n	nethod, and will research more and with a description of steps ve water.	to get students started on the right track before completing the assignment at a later date, or at home.

Have the students answer a series of prediction questions:

- What do you think will happen to the water?
- How long do you think it will take for the water to evaporate?

Do you think evaporation needs cold or hot water? What is the sun doing to the water? How much water do you think will eventually collect in the small container?

(20 minutes)

Observe the model over the next few days. Note whether salt deposits are being left in the large bowl as water evaporates from the large bowl, condenses on the underside of the plastic wrap, and eventually drips run down to the low point and drop into the small container.

Closure/reminders

The class will be making observations of what is taking place over the next few days. Does the water condensing on the underside of the plastic wrap have any color? How about the water in the small container? Watch as salt deposits form on the large bowl as water evaporates. Ask students if solids can evaporate, like water can? Ask if they think the water in the small container is salty or nice and fresh? Would the water in the large bowl taste even saltier than it was before the experiment? The teacher can taste the water from the small bowl and confirm whether it is salty or fresh.

Assessment (how you will know students met the objectives - include rubrics)

By predicting what will happen during the experiment demonstrates their understanding of how the water cycle works.

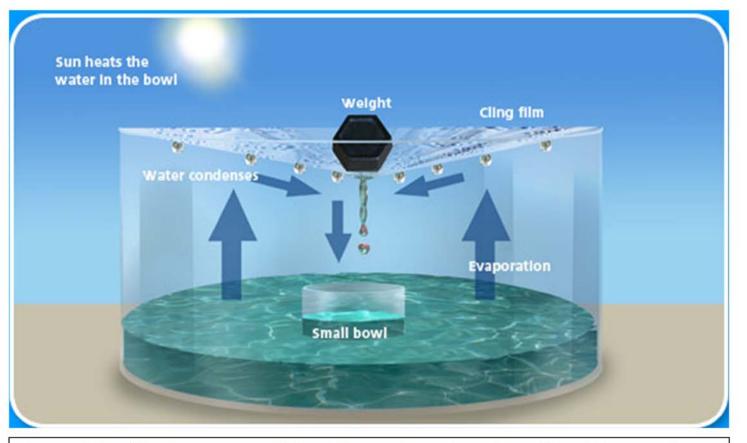

Photo Credit: http://shoalwater.nsw.gov.au/education/watercycle_experiment.htm. Additional information about this experiment is available here, too.

A Letter from the Editor

2015 Aquifer Atlas Teacher Resources: Outline

Dear Teachers, Parents, School Administrators, and Students,

Welcome! The Idaho-Washington Aquifer Collaborative members are so very happy that you have found your way to this useful teaching tool. The Teacher Resource Guide is designed to provide a list of curricula, activities, and student projects related to developing content knowledge in the science related to the Rathdrum-Spokane Aquifer, and tied to ID/WA Common Core Math and the Next Gen Science Standards.. The authors see this guide as the "cookbook" to use to develop standard-based lessons that relate to the magnificent aguifer below our feet; it is the only source of drinking, farming, and industrial-use water for almost all of us who live, work, and play from Farragut State Park near Athol, ID to the upper end of Long Lake and Nine-Mile Falls area. The science, technology, engineering, and mathematics (STEM) lessons, not to mention art, literacy, writing, and social science skills, that can be taught through the use of the Atlas in the classroom are vast. These are only a starting point, and this Guide will continually be updated, expanded, and improved. Please contact the University of Idaho Extension, Northern District, IDAH₂O program with ideas, questions, corrections, and other information.

This guide follows the Aquifer Atlas and provides descriptions of at least one lesson or activity per grade band for each Atlas section. Grade bands include,

K-3 (Lower Elementary School)

3-6 (Upper elementary School)

Future versions will include lesson plans for middle and high school grade bands. 7-8 (Middle School)

9-12 (High School)

These curricular resources have been developed collaboratively by educators and scientists, and are assembled here so that teachers can more easily use the Atlas as an effective science and math teaching tool.

There are two sections to this guide. The first section includes resources that are available for teachers beyond the classroom. This section relates closely with the Aquifer Tour pages (page 10), as many of these resources are field experience locations. The second section includes lesson plans that relate directly to pages in the aquifer, for a range of grade bands and supporting a variety of CC and NGSS standards. These are arranged more or less in order of the 2015 Aquifer Atlas, then by grade band.

Sincerely, -Jim

Jim Ekins Area Water Educator, UI Extension Northern District 208-292-1287 jekins@uidaho.edu

It is the policy of the University of Idaho Cooperative Extension System that all persons shall have equal opportunity and access to the programs and facilities without regard to race, color, sex, religion, national origin, age, marital status, parental status, sexual orientation, or disability.

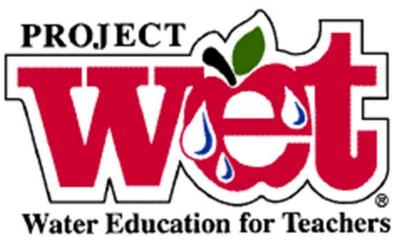

Section 1: Resources related to the Aquifer Atlas

How can I find what is readily available for teachers, educators, and parents? A list of places to go, potential field excursions, and sources of information related to the Atlas Aq-uifer.

Water-based Curriculum: External sources of lessons and activities

Project WET

Project WET provides teachers and resource professionals with accredited workshops designed to provide non-advocacy, hands-on, interdisciplinary water education materials and instruction. This program trains teachers in use and application of the "Project WET Curriculum and Activity Guide", ground water flow models, Enviroscapes and water history trunks.

Cooperative Extension Service of the University of Idaho and Washington State University

The University of Idaho and Washing-

ton State University have a wide variety of natural resources and environmental education related 4-H curriculum and activities available, far beyond just aquifers and groundwater. For University of Idaho projects: <u>http://</u> <u>extension.uidaho.edu/canyon/files/2013/02/Project-Requirements-Handbook-2013-2014.pdf</u>. For Washington State University Projects: <u>http://</u> <u>cru.cahe.wsu.edu/CEPublications/em2778/EM2778_2014.pdf</u>.

University of Idaho Extension's Volunteer Water Quality Monitoring Program, IDAH₂O Master Water Stewards is a citizen-science project that provides training for volunteers who would like to do regular water quality monitoring on surface waters across Idaho. <u>http://www.uidaho.edu/cda/</u> <u>idah2o</u>

4-H

4-H2O Online: a community for youth to learn about water quality, water conservation and watershed issues. Throughout this site you'll find 4-H's "Exploring Your Environment" Grab-n-Go's and information on how youth nationwide are addressing water issues in their communities. Get started by watching the vodcast series "A Day Without Water" to learn more about how you can make an impact in your community! <u>http://www.4-h.org/youth-development-programs/4-h-scienceprograms/environmental-science-alternative-energy/4h2online/</u>

There's No New Water: There's No New Water! is a 4-H water conservation and water quality curriculum grounded in a simple yet powerful concept that water is a finite natural resource whose quantity and quality must be responsibly preserved, protected, used, and reused.

The There's No New Water! curriculum is designed for high school age youth, with six sequential learning modules that utilize effective pedagogy and scaffold learners' knowledge and skills. The curriculum is intended for delivery in out of school group settings and facilitated by an adult.

The curriculum begins with an exploration of the natural water cycle; explores human interventions that affect water quality and quantity; examines the effects of the urban/rural interface on water quality and quantity; includes the identification and implementation of service-learning projects that address local water conservation issues; and culminates with a set of activities for younger youth and families designed to be led by teens as teachers.

Extending Knowledge and Changing Lives

All activities in the curriculum are designed around the use of inquiry and experiential learning. Inquiry is a teaching strategy where individuals are engaged in learner-centered activities that involve observing and manipulating objects and phenomena and acquiring or discovering knowledge. <u>http://www.4-h.org/resource-library/curriculum/4-h-theres-no-new-water//</u> <u>Pend Oreille County</u>

Stevens Co

Community Water Resources Center (CWRC) at University of Idaho-Coeur d'Alene:

provides resources for all ages on a wide range of water related topics. Educational programs include the development of "station-style" events at which larger numbers of students are divided into groups of ten to fifteen, and rotate among a given number of stations. Each station is a hands-on lesson lasting from 15– to 45 minutes. CWRC has a laboratory open for K-12 use under the supervision of our Lab Coordinator, a certified science teacher who can help you met your curricular needs. Contact the CWRC at UI for additional information: <u>http://www.uidaho.edu/cda/cwrc</u> and <u>http:// www.uidaho/cda/extension-outreach/outreach-opportunities</u>

West Valley Outdoor Learning Center:

The purpose of the West Valley Outdoor Learning Center is to give teachers and students an opportunity to have experiences in an outdoor setting while instilling an appreciation for fish, wildlife, and our natural resources. All activities are tied to the Washington State Essential Academic Learning Requirements. <u>http://www.wvolc.org/</u>

Programs and Hands-On Activities

Groundwater Model: A mobile window into the aquifer

Courtesy: This program can be delivered by the IDAH2O WatershEducation Program as a U-Idaho Extension Program. Alternately, a high school classroom instructor with some basic carpentry experience can build an aquifer model using wood, plexiglass and other materials. See the EPA "Building a Model Aquifer" page at (<u>http://</u> <u>water.epa.gov/learn/kids/drinkingwater/upload/2009_04_29_kids_activity_grades_9-</u> <u>12_buildingamodelaquifer.pdf</u>). See also Groundwater Model Lesson Plan in section 2 of this Guide.

Grades: 4-9

Context: Aquifer Atlas pages

Overall Goals: Students will use a hands-on model to understand and demonstrate aquifer concepts, aquifer components and structure, and interrelationships among the aquifer, river, and water well use.

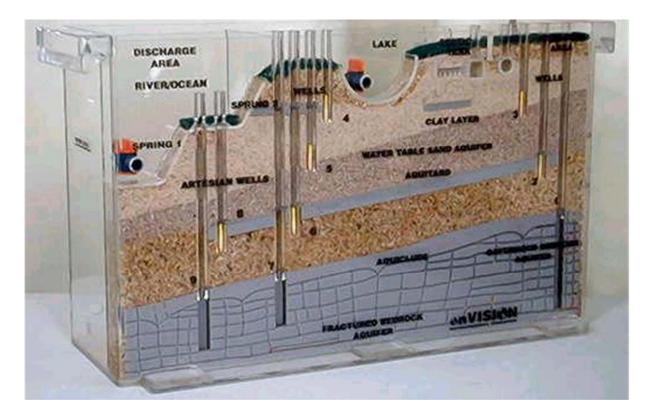

Learning Objectives: Students will:

- build and/or view a model aquifer;
- define and explain what they have observed from using a scientific model;
- learn to differentiate an explanation from a description.

Time Required: Setup 15 minutes (with existing aquifer model) to 2 hours (if building a new model), activity 45 minutes.

Materials:

For additional details, see the <u>EPA Aquifer Model as described above</u> and also other aquifer modeling activity descriptions such as <u>Wessels Learner Model Aquifer</u>, or the Active Watershed Education Curriculum's <u>Testing out an</u> <u>Aquifer</u>.

The students will open up their writing journals and their story. As they finish up with their stories, they piece of construction paper from the back table and drawing of their story using utensils from their pers box. (25-30 minutes).

I will have the students turn their writing journals in so I can check completion of the assignment (1-2 m

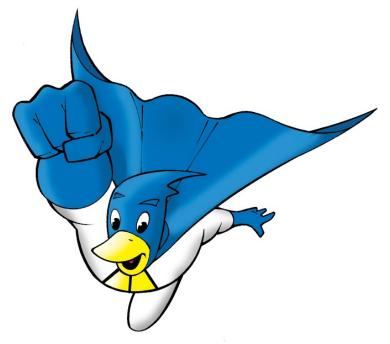

Any students who completed a drawing of their sup wants to display it, may add it their portfolio folder Closure/reminders:

I will close the lesson by reminding students that any art work they would like to display or add to their portfolio can be put into the folder when completed. I will also remind them that an artist statement will also need to be included for any portfolio art.

Assessment (how you will know students met the objectives - include rubrics) I will assess students work by reviewing and grading their superhero story. They will receive 1 point for each of the five paragraphs, and one point each for the 3 requirement questions, as well as another point for neatness and lastly a point for punctuation and spelling making the total assignment worth 10 points.

nd begin writing	I will have them complete the assign-

Mobile Bug Lab: Who else is in your favorite swimming hole?

Courtesy: This program was developed by the IDAH2O Watershed Education Program. It Teachers or schools can easily find the bug viewers and dissecting microscopes for sale on line. It is less-closely related to the Aquifer Atlas specifically, but more oriented toward water quality in general, and will expose the students to the use of basic scientific equipment.

Grades: 4, 6, 10

Context: Aquifer Atlas pages

Overall Goals: Students will capture, view, describe, draw, and learn about what aquatic macroinvertebrates can tell us about water quality in local streams and rivers, some of which feed the Aquifer.

Learning Objectives: Students will:

- Differentiate between the terms, macro and micro, aquatic and terrestrial, and vertebrate and invertebrate •
- Learn two pollution sources and four types of water pollution
- Differentiate between visible pollution, visible signs of invisible pollution, and invisible pollution ٠
- Identify types of macroinvertebrates using an identification key (younger students) or a dichotomous key (older students)
- Create written descriptions and/or technical drawings of individual macroinvertebrates
- Learn how to use a basic microscope ٠

Standards or Curriculum:

Time Required: Setup 30 minutes, activity 20-45 minutes.

Materials: Table(s) for microscopes and bug viewers (provided).

 1995- IDEQ adopts guidelines for land applying over the aquifer

 1999- efforts to halt a new train refueling depotential grass roots aquifer protection movements

2007- Kootenai county residents vote to form and fer protection district to form aquifer programs. (1 minutes)

Have students turn "IN" their timeline for a compl and come back and sit at their desks with everythin (2 minutes)

Water Quality Monitoring: Be a Water Superhero

Courtesy: This program can be delivered by the IDAH2O WatershEducation Program as a U-Idaho Extension Program. Alternately, a high school classroom instructor with some basic carpentry experience can build an aquifer model using wood, plexiglass and other materials. See the EPA "Building a Model Aquifer" page at (http:// water.epa.gov/learn/kids/drinkingwater/upload/2009 04 29 kids activity grades 9-12 buildingamodelaquifer.pdf). Contact University of Idaho WatershEducation Program, 208-292-1287 or jekins@uidaho.edu.

Grades: 4-9

Context: Aquifer Atlas pages

Overall Goals: Students will use a hands-on model to understand and demonstrate aquifer concepts, aquifer components and structure, and interrelationships among the aquifer, river, and water well use.

Learning Objectives: Students will:

- build and/or view a model aquifer;
- define and explain what they have observed from using a scientific model;
- learn to differentiate an explanation from a description.

Standards or Curriculum:

Time Required: Setup 15 minutes (with existing aquifer model) to 2 hours (if building a new model), activity 45 minutes.

Materials: a \$20 fee to cover the cost of materials can be sent to UI Extension. Call for more details

I will then gather my poster board and show stu outline of the aquifer using the outline. The ma board within reason. Next I will show how to du tions. Have students label each section with pe be drawn next. Remind students that we will ne creeks in after we have our map put together.

After stenciling the aquifer and lakes, grab a pi from the class bucket and cut out a portion to the students to estimate how much material th tion. They can cut it with more detail after. (Ste process with each section of the aquifer before

Cut section of recycled material to closely rese is to represent. (Once <u>all</u> sections are closely cu move on to gluing)

Glue on section to the correct area. Remind stu all their sections cut in detail before they may s pre-made toothpick markers (in top right correct the sections after all sections are glued in place

Have students place finished projects on drying projects should be placed on the back table.

Closure/reminders

Summarize at the end of the allotted time how far each group has left on their project.

Assessment (how you will know students met the objectives - include rubrics) As students work on the project I will walk around the room. Ensure students are using their section and rivers, lake and creek lists to properly represent each area. Summative assessment will be completed on students completed maps.

I will point to the 7 different colored areas: northern Rathdrum prairie, southern Rathdrum prairie, eastern Spokane valley, Spokane area, western arm, Hilliard trough and little Spokane river arm. I will locate and point out the connecting rivers, lakes, and creeks: Spo- kane river, Long, Lake, Deep Creek, Little Spokane River, Hangman Creek, Liberty Lake, Newman Lake, Hauser Lake, Coeur d'Alene Lake, Fernan Lake, Hayden Lake, Twin Lakes, Spirit Lake and Lake Pend Oreille. (3 minutes)	to remind students how important recycling is I will review recycling to help students choose materials for their pro- ject that accurately fol- low the "reduce, reuse and recycle" moto. This will be another step in aiding their understand- ing of recycling I have made a printed lis for students' easy refer- ral and so they can chec off items as they move along in their project. It will be a good way for m

Section 2: Aquifer-Related Lesson Plans and Activities

Lesson Plans, mapped to standards, to be used with the Aquifer Atlas

The following lesson plans and activities were created my many individuals and organizations. Some of these are developed by organizations and agencies devoted to protecting the aquifer, and adapted to fit this publication. Others were developed by the University of Idaho, College of Education, Department of Curriculum and Instruction students in a class called Teaching Culturally Diverse Learners. A major component of this class is development of lesson plans for a wide variety of ages, and then mapping those lesson plans to state standards in science, math, and English language arts (known as the Common Core ELA and Next Generation Science Standards), as a service-learning project.

There are two subsections. First is a section of activities and experiments that can apply to a broad range of grade bands. The second subsection is a series of elementary-grade-level lesson plans developed by UI College of Education students. These sometimes refer back to the activities described in the first subsection.

Each lesson plan is organized in a similar manner.

Title and Subtitle

Courtesy: Each lesson plan is referenced to the author or source. Often lesson plans and activities have multiple sources, or have been copied from earlier sources, and therefore variations that might fit a class need might be found with some searching. The editors of this publication were not able to delve into the history of every lesson plan. Please address needs for additional information or clarifications to the editors. Grades: Most of these lessons can be used for a range of student ages or within a broader grade band. Context: Each lesson plan or activity is related to a specific Aquifer Atlas page or pages. Overall Goals: of each lesson plan or activity are described. Learning Objectives: of each lesson plan or activity are described, using the sentence: "The student will..." Standards or Curriculum: A list of relevant connections to Common Core standards, and usually Next Generation Science Standards, is provided with each lesson plan or activity. Time Required: Includes an estimated time needed for activity setup, as well as the activity itself. Materials: a list of materials required for each activity is provided. For additional details: some of these are part of a larger set of lessons or activities, or for which there are additional materials or program information available.

The Hydrologic Cycle

Where does water come from, and where does water go?

Courtesy: Idaho Department of Environmental Quality: Gary Stevens, 06/09

Grades: 3-6

Context: Aquifer pages 11 and 12 (Water Cycle and Water Budget)

Overall Goals: Learn about the hydrologic cycle:

Learning Objectives: Students will:

- Explain at least five places where water is found
- Know the steps of the hydrologic cycle
- Know five hydrologic cycle terms and place them in proper location on a water cycle diagram
- Describe how water moves from one step to another

Standards or Curriculum: Common Core ELA:

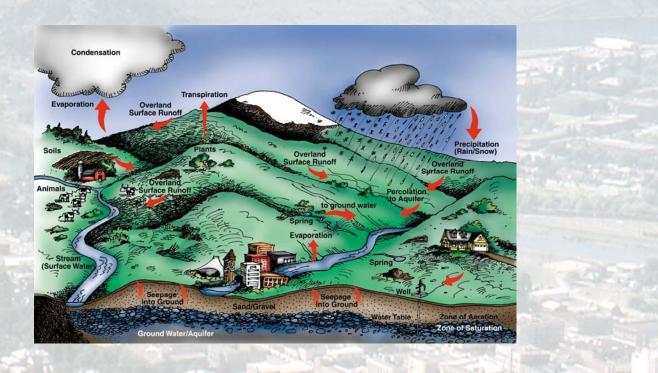

- 3rd Grade: W.3.9 (3-LS4-1); SL.3.4 (3-LS4-2)(3-LS4-3)(3-LS4-4)
- 4th Grade: SL.4.4 (4-LS1-2); W.4.7 (4-ESS3-1); W.4.8 (4-ESS3-1)
- 5th Grade: RI.5.7 (5-LS2-1)

Time Required: Setup 20 minutes, activity 60 minutes

Materials: Hydrologic cycle illustration, hydrologic cycle animation (<u>WMV</u> or <u>SWF</u> format), small beaker, a houseplant, plastic wrap, and tape

For additional details and the entire lesson plan, go to the following web address and click on Lesson #1: <u>Where does water</u> <u>come from, and where does it go?</u> (<u>https://www.deq.idaho.gov/regional-offices-issues/coeur-dalene/rathdrum-prairie-aquifer/educational-tools.aspx</u>)

Hydrologic Cycle: The water on earth is always on the move, and eventually it ends up right back where it started. This movement is called the hydrologic cycle or water cycle.

Next I will show how I used this measurement to cubar graph "+91" represents a gain of 91 million gall the length with scissors and use the glue stick to put

Using the same sharpie, label the bar "+91" as show graph. (Step 4-8, 5 minutes)

I will leave my completed bar graph on the smart b ence. I will then have students take out their aquife 14 so they can use the data to construct their bar g

I will tell students they can open their supply box a While they work on their bar graphs I will circle the are on track and are understanding the assignment Closure/reminders

I will take out my water bottle pour half of it out. I will ask students to silently think about whether there was a gain or loss of water from my water bottle. Was it a negative loss or positive gain?

Assessment (how you will know students met the objectives - include rubrics) What does the color orange represent on the streamflow graph? What is the difference between orange and blue on the graph? Why do they use "-" to represent loss? Do you think the same loss and gain

We can start any place, so let's start with **precipitation**. Precipitation is another name for rain and snow. When rain falls on the land or snow melts, it flows into rivers or streams. After a lot of rain or in the spring when all the snow melts, streams and rivers often have a lot more water in them. In the water cycle, this is called **surface runoff**. The water in the streams and rivers can flow all the way to lakes and eventually even the ocean.

The rain and melted snow can also be absorbed into the ground. When this happens, it's called **infiltration**. The infiltrated water adds moisture to the soil and rock. If enough water is added, it will completely fill all the empty spaces in the soil and rock.

If all the empty spaces are full of water then we have an aquifer. The water in an aquifer is also called ground water. Moving ground water is called ground water flow. Ground water moves very slow, usually only a few feet a day.

Plants need water and nutrients to live. Plants get water and nutrients from the soil through their roots. When plants absorb water and nutrients from the ground it's called root uptake.

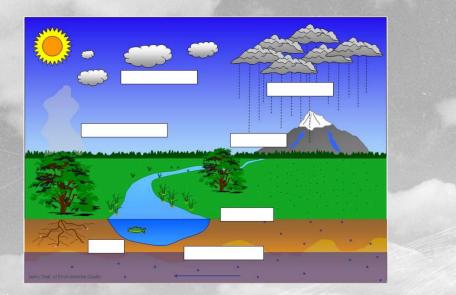

The water goes up through the plant to its leaves where it's released into the air. The process of plants releasing water into the air is called **transpiration**. A mature tree can transpire 50 to 100 gallons of water a day in the summer.

Some water doesn't make it to streams or rivers. When the sun comes out, the heat causes the water on plants or on the surface of the land to evaporate back into the air. The combined process of evaporation and transpiration are called evapotranspiration.

All evapotranspirated water rises up into the atmosphere where the air is very cold. The water starts to collect together in a process called condensation. When there is enough condensation, clouds form. When there is enough water in the clouds, it starts to rain and snow or precipitate. Now we are right back where we started on the first page! Water from precipitation will move again through the hydrologic cycle.

Activities:

- 1. Download the hydrologic animation at www.deq.idaho.gov/rathdrumprairieaquifer.
- 2. Fill in the empty boxes of the illustration of the hydrologic cycle.
 - Fill in the empty boxes with the steps of the hydrologic cycle.
 - Draw arrows from one box to another showing the direction of the cycle.

Beaker or Measuring Cup Experiment

Fill a measuring cup with exactly 1cup of water. Leave the cup out on a table or window sill. The water will start to disappear. Fill out the table on Page 4 and explain how this relates to the hydrologic cycle. What might make the water disappear faster?

Start with exactly 250 milliliters or 1 cup of water in container. Every day measure how much water is left and record the information in this table.

Date	Time	How much water is in the measuring cup?	Hallo I.
		- internet in the second	
-	and the second		- Calling
Carton Marine			
	C. C		Transis prise P
J. S. S.		the state ball is dealer bar in	

Take a house plant and lightly water it. Then loosely cover the plant or one branch with clear plastic wrap. Gently secure the plastic wrap around the pot or base of the branch with some tape. Make sure you just tape the pot or the plastic around the branch instead of the plant itself. Wait a few days and water will start to form on the inside of the plastic. What is happening? How does this relate to the hydrologic cycle?

Observe the model over the next few days. Note whether the water in the smaller container, or the water that condenses on the underside of the plastic wrap has color in it, (Optional, note whether salt deposits are being left in the large bowl) as water evaporates from the large bowl, condenses on the underside of the plastic wrap, and eventually drips run down to the low point and drop into the small container.

Closure/reminders

The class will be making observations of what is taking place over the next few days. Watch as salt deposits form on the large bowl as water evaporates. Ask students if solids can evaporate, like water can? Ask if they think the water in the small container is salty or nice and fresh? Would the water in the large bowl taste even saltier than it was before the experiment? The teacher can taste the water from the small bowl and confirm whether it is salty or fresh.

Assessment (how you will know students met the objectives - include rubrics) By predicting what will happen during the experiment demonstrates their understanding of how the water cycle works.

Groundwater Model A mobile window into the aquifer

Courtesy: This program can be delivered by the IDAH2O WatershEducation Program as a U-Idaho Extension Program. Alternately, a high school classroom instructor with some basic carpentry experience can build an aquifer model using wood, plexiglass and other materials. See the EPA "Building a Model Aquifer" page at (http:// water.epa.gov/learn/kids/drinkingwater/upload/2009_04_29_kids_activity_grades_9-12 buildingamodelaquifer.pdf).

Grades: 4-9

Context: Aquifer Atlas pages

Overall Goals: Students will use a hands-on model to understand and demonstrate aquifer concepts, aquifer components and structure, and interrelationships among the aquifer, river, and water well use.

Learning Objectives: Students will:

build and/or view a model aquifer;

define and explain what they have observed from using a scientific model;

learn to differentiate an explanation from a description.

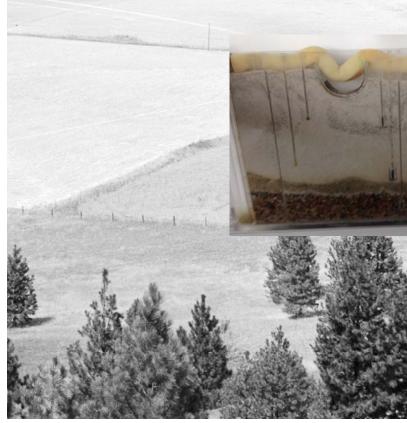

Standards or Curriculum:

Time Required: Setup 15 minutes (with existing aquifer model) to 2 hours (if building a new model), activity minutes

and the set

Materials:

For additional details, see the EPA Aquifer Marcel as described above and also other aquifer modeling activ scriptions such as Wessels Learner Model Aquifer, or the Active Watershed Education Curriculum's 1 Aquifer.

How does water under the earth's surface move?

Courtesy: Idaho Department of Environmental Quality: Gary Stevens, 06/09

Grades: 3-6

Context: Aquifer Atlas pages

Overall Goals: Students will learn about the nature of ground water and how it moves

Learning Objectives: Learn about ground water and:

Students will describe how ground water moves into and through different substrates

Students will identify two specific characteristics of ground water movement

Students will describe two different types of ground water movement

Standards or Curriculum met:

Time Required: Setup, activity

Materials: Ground water animation (<u>WMV</u> or <u>SWF</u> format), two beakers, 250 mil or one of cup gravel, 250 mil or one cup of cup sand

For additional details and the entire lesson plan, go to the following web address and click on Lesson #2: <u>How does water under the earth's surface move?</u> (<u>https://www.deq.idaho.gov/media/471623-ground_water_lesson_plan.pdf</u>)</u>

Ground Water: Ground water is water below the earth's surface. The water from rain or melting snow will seep or infiltrate into the surface.

The infiltrated water will move downward. The water moves in empty spaces between the soil particles. If the empty spaces only have a little water in them, then the soil is moist or unsaturated. If all the empty spaces are completely filled with water, then the soil is wet or saturated.

and a section of the

The amount of empty spaces in soil is called porosity. In general, the more porous a soil is, the easier it is for water to move through it. Which has greater porosity—the gravel or granite?

A measure of how easy or hard it is for water to move through soil is called hydraulic conductivity. If water can move through a soil easily the soil has high hydraulic conductivity. If it is difficult for water to move through a soil, the soil has low hydraulic conductivity. Which has greater hydraulic conductivity—gravel or granite?

Water in the unsaturated zone seeps or infiltrates downward. It continues to move downward until it encounters bedrock or silt, something with low permeability. The water then starts to fill up all the empty pole spaces, and the soil or rock becomes saturated. The top of the saturated soil is called the water ta-

Once the soil becomes saturated, water starts to move sideways. The water typically moves from high elevation areas such as hills and mountains to low elevation areas such as lakes and oceans. Remember from Lesson #1 how fast water moves? It's usually only a few feet a day.

To spark imaginations, I will prompt students with them on the white board (2 minutes):

•Where did the water drop go on its journey?

What did it see? What adventures did the drop have the drop have the did it feel at different times?

•Did the drop meet any plants, animals, or people drop help them?

•How long did the drop's trip take?

•Where does the water drop want to go on its next

I will encourage students to use the picture of the atlases to help them as they begin working on the walk around the room to answer questions and re priate grammar (15-20 minutes).

Toward the end of the lesson, I will ask if any stude ry with the class. As a class, we will briefly discuss in each story. I will then have students turn in thei box on my desk (5 minutes).

Closure/reminders

I will ask students if and how writing in first person helped them understand the water cycle. I will ask them how the story would look different if we were writing in third person.

Assessment (how you will know students met the objectives - include rubrics)

I will proofreading their stories in their writing journals and check to see if they met the requirements of using 3 parts of the water cycle & vocabulary terms. I will also use red pen to mark any errors in spelling and punctuation. If students meet requirements, I will put a star at the top right corner so students know they are ready to move onto their final drafts.

Reflection/evaluation (after lesson is taught) The prompts worked really well in opening the class's imagination. I noticed 90% of the class was able to move though the story without having to stop and think of what to write next.

Class activities (wh	at you/students will do)	Class activities (why
I will begin the less	on with "the Water Cycle video" (2 minutes).	you will do them)

After viewing the YouTube video, we will discuss as a class the different stages of the water cycle that occurred in the video. I will ask students to raise their hands and share what they saw in the video that relates to the water cycle as I write it on the white board (3 minutes).

I will then tell the students that we are going to write about the experiences of one water drop as it travels through the water cycle. I will explain to the students that they will write from the water drop's point of view (1st person). Have students work independently to each write a story about one water drop's journey. I will answer any questions students may have about the assignment (3 minutes).

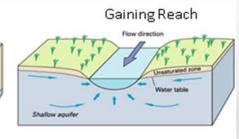

I will give students the option to begin their journeys in different places. I will write the following ideas on the white board: a puddle on a farm, a mountain lake, a stream in a meadow, or a large ocean (2-3 minutes).

I will encourage students to use what they just learned, as well as their imaginations, to tell an interesting story that needs to be at least three paragraphs long (minimum of 5 sentences each). I will explain to them the requirements for the assignment and how they need to include at three stages of the water cycle in their story, including: Evaporation, Transpiration, Condensation, and Precipitation. I will write these on the board for the students to see the requirements and be able to refer to them while writing their stories (3-5 minutes). Class activities (why you will do them) I am going to play this video to give an example of a story using first person perspective.

I am discussing the lesson requirements to give students an overview of their responsibility in regard to the assignment and giving them a chance to clear up any confusion they may have.

I will suggest different options for their journeys to give them ideas as to where to start their assignment and help streamline the process.

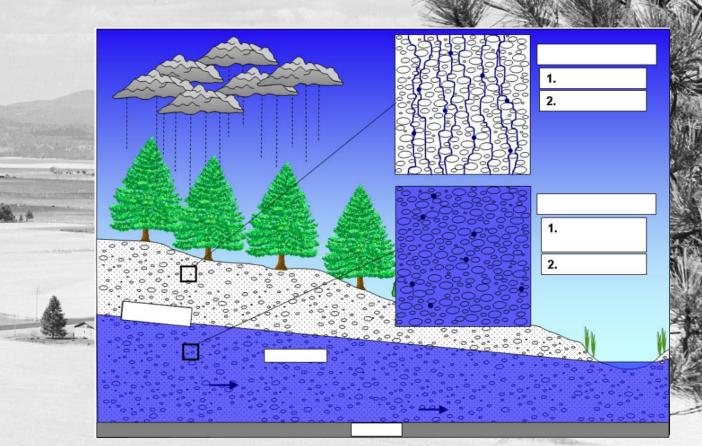

Notice on the right side of the diagram above, the top of the water table is the same as the top of the stream.

The ground water is flowing into the stream. This is called a gaining stream. Sometimes the water table is below a stream, like on the left side above, and the stream loses water by seeping out of the bottom. The water then flows downward to the water table. This is called a losing stream.

Exercises:

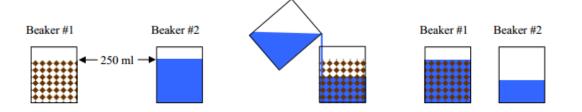

Download the hydrologic animation at www.deq.idaho.gov/Rathdrumprairieaquifer.

Fill in the empty boxes in the illustration of ground water movement, describing the two types of zone

Fill a beaker with exactly 250 ml of sand Take another beaker and fill it with exactly 250 ml of water. Slowly pour the water from the beaker into the beaker with the sand. How much water can you pour into the sand before the water flows over the top of the sand? Determine at what point the sand is unsaturated and when it's saturated.

Now remove the sand and perform the experiment again but instead of sand use gravel. What's the difference between the two? Which one has greater porosity? Which one has greater hydraulic conductivity?

Note: you can also do the experiment with a mixture of soil and gravel or sand. How does it differ from the experiments above?

Type of soil (potting soil, sand, gravel)	How much soil is in the beaker #1?	How much water is in the beaker #2?	How much water is left over in the beaker #2?

I will continue the video and have students draw a third of their circle representing condensation representing recharging the aquifer (5 minutes).

Watch the remainder of the video (1-2 minutes).

I will give the students time to finish up their drawi tion of the water cycle on their papers (5-8 minutes

I will then have students pair up with a partner and of the water cycle and how they contribute to the around the room to listen and check for student up minutes).

After the students are finished discussing and shar their partners, they will turn in their assignments t my desk.

Closure/reminders:

I will ask students if they learned anything new about the water cycle or if they made any new connections about the water cycle that they learned in previous grades.

Assessment (how you will know students met the objectives - include rubrics) I will assess students as we work as a class by calling on different students through cold call to help explain the cycles and drawings that represent it. I will also review students turned in work and make notes on students papers.

Accommodations/differentiation:

For the advanced ALP students who finish the assignment early, I will extend the assignment by having students personalize the water cycle by connecting it to where they live and how nearby water features connect to the nearest ocean.

Aquifer in a Cup The Incredible, Edible Aquifer

Courtesy: Many versions of this activity exist. Some use ice and other lower-calorie/sugar ingredients.

Grades: Any; best fits grades 4-8

Context: Aquifer Atlas pages

Overall goal: to illustrate the geologic formation of an aquifer, how pollution can get into ground water, and how this pollution can end up in drinking water wells.

Learning Objectives:

Students will describe how surface pollution can affect ground water Students can describe different layers and parts of an aquifer Students will learn five vocabulary terms specific to aquifers and groundwater and definitions

Standards or Curriculum met:

Time Required: 30 minutes setup; ~30 minutes for activitiy (can be longer or shorter depending on discussion) Materials: (Class of 25)

Chocolate sprinkles: 2 (3 oz.) containers

Clear plastic cups: 25-30 (12 or 16 oz.) cups

Clear soda (e.g., lemon-lime): 4 liters

Crushed ice (the smaller the better): ≈ 1 bag

Mini marshmallows: 1 (16 oz.) bag

Chocolate chips: 4 (12 oz.) bags

Puffed cocoa cereal: $\approx 1/4$ cup per student

Red Kool-Aid[®] (sweetened and dry): 4 small pkgs.

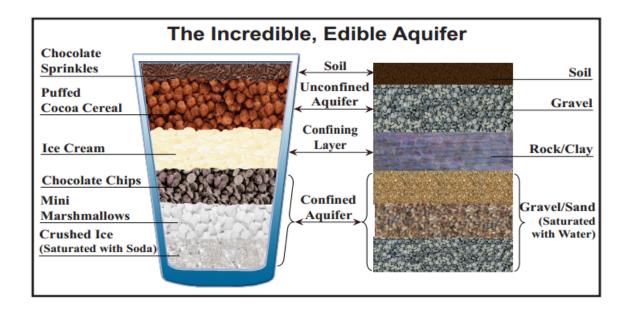

Spoons: 25-30

Straws (preferably clear): 25-30

Vanilla ice cream: 25-30 single serving cups

For additional details, go to Idaho Department of Environmental Quality's Education Resources for Teachers page (<u>http://www.deq.idaho.gov/assistance-resources/educational-tools/teacher-resources.aspx</u>) for additional details and other activities.

Focus: Students will build their own edible aquifers and learn about different geologic layers, different types of aquifers, how aquifers become contaminated, and the need to protect and conserve ground water resources.

Background:

Ground water supplies 95% of the drinking water in Idaho. Wells are drilled through soil and rock into ground water aquifers to supply drinking water. Unfortunately, ground water can become contaminated by improper use or disposal of chemicals such as fertilizers and household cleaners. These chemicals can percolate down through the soil and rock into an aquifer and eventually into drinking water wells. This contamination can pose a significant threat to human health.

Vocabulary:

- Aquifer: A natural underground area where large quantities of ground water fill the spaces between rocks and sediment.
- *Confined Aquifer*: An aquifer overlain by one or more layers of impermeable rock or soil (aquitard/confining layer) that restrict water to within the aquifer.
- *Confining Layer*: An underground layer over an aquifer that is impermeable or significantly less permeable than the aquifer below it. It helps protect the aquifer from contamination and is usually made of rock and/or clay. Also called an "aquitard."

Conserving Water: Not wasting water.

Porous: Full of pores (small spaces). Water can easily pass through it.

Protecting Water: Keeping water clean.

Saturated Zone: An underground layer or area where water fills most of the pores (spaces) in the soil and rock.

Unconfined Aquifer: An aquifer that is not overlain by a layer of impermeable rock or soil.

Unsaturated Zone: An underground layer or area where air fills most of the pores (spaces) in the soil and rock.

Water Table: The top of an unconfined aquifer.

Procedure:

Step 1: Fill a clear plastic cup 1/3 full (total) with a layer of crushed ice followed by a layer of each like the picture shows of mini marshmallows and chocolate chips.

These represent gravels and sands that make up the aquifer. Notice the different sizes and shapes and

how the pieces have spaces or "voids" between them.

Step 2: Add enough soda to almost reach the top of the layer.

The soda represents ground water. Notice that the soda fills all of the spaces among the marshmallows, chocolate chips, and ice. The aquifer is now saturated with soda; it is a "saturated zone." In an unconfined aquifer (see Step 3), the top of the saturated zone is called the "water table."

Step 3: Add a layer of ice cream. (Optional.) (For a tight seal, gently spread out the ice cream to the inside edges of the cup and slightly up the sides using the back of a spoon.)

This layer, called a "confining layer" or an "aquitard," is impermeable or significantly less permeable than the aquifer below it (it is difficult for water to soak through). It helps protect the aquifer from contamination and is usually made of rock and/or clay. An aquifer under a confining layer is called a "confined aquifer." An aquifer without a confining layer or above a confining layer is called an "unconfined aquifer."

Some aquifers, such as the Spokane Valley-Rathdrum Prairie Aquifer in north Idaho, do not have a confining layer. Since this aquifer does not have a confining layer, consider omitting the ice cream or having half the class use ice cream and half not to compare the results.

Step 4: Add puffed cocoa cereal (or use more crushed ice) on top of the confining layer/water table. This represents the unsaturated zone, the area where air fills most of the pores (spaces) in the soil and rock.

Step 5: Scatter chocolate sprinkles over the top. The sprinkles represent the soil, which is very porous.

your aquifer.

Step 6: Sprinkle Kool-Aid[®] over the top of the soil.

The Kool-Aid[®] represents contaminants on the ground (e.g., fertilizer). Does anything happen to the Kool-Aid[®] right away? (Usually nothing will happen.)

Step 7: Using a drinking straw, "drill" a "well" into the center of the aquifer.

Step 8: Begin to "pump" the well by slowly sucking on the straw.

Watch the decline in the level of soda and observe what happens to the contaminants. Do contaminants (Kool-Aid[®]) leak through the confining area (ice cream) and get sucked into the well? If so, do more contaminants get into wells in confined or unconfined aquifers? (Applicable if your class made both; see Step 3.)

Step 9: Pour a small amount of soda over the top.

The aguifer is now complete. Your aguifers will probably be messy and not look like the picture on the front page. That's OK! Real aquifers aren't neatly layered either. Next you will explore how contaminants and wells interact with

Observe the aquifer and Kool-Aid[®]. What, if anything, happens when the well is drilled?

The soda represents precipitation. It recharges the aquifer (adds new water). Watch how the Kool-Aid[®] dissolves and moves into the aquifer. The same thing happens when contaminants are spilled on the ground. Do you think you could get the Kool-Aid[®] back out of the soda?

Review what you have learned and eat your aquifer! Use these questions to start the discussion.

Questions for Discussion:

- What observations/results surprised you? What did not?
- How did results compare among different aquifers? (Even if all students used the same option in Step 3, each aquifer will be somewhat different.)
- What parts of the activity were most/least like what would happen with a real aquifer? Why?
- What happens if all of the water is pumped out of an aquifer? Where does more ground water come from? How long do you think it would take? Is there always more ground water, or could we run out?
- Do you think a contaminated aquifer can be cleaned? If so, how?
- How can we conserve (save) ground water? What specifically can kids do?
- How can we protect ground water (keep it clean)? What specifically can kids do?

Assessment/Follow-Up:

Before the Activity:

Ask students to define "ground water" and "aquifer." Record their key words on a white board to compile relatively accurate definitions. Leave the definitions on the board.

After the Activity:

- Complete "Questions for Discussion," above.
- Refer back to the definitions students wrote before the activity. Ask if they would like to modify them.
- Have students list as many potential ground water contaminants as they can.
- Include vocabulary in spelling lists.
- Test on definitions of vocabulary.
- Have students research ground water and aquifers in your area and compile an oral or written report.

Thurston's Groundwater Movement Activity A window into the earth so you can see what's beneath your feet

Courtesy: U.S. EPA Office of Water (http://www.epa.gov/ogwdw/kids/pdfs/activity_grades_k-3_groundwatermovement.pdf), and adapted from the National Project WET Program. Project WET provides teachers and resource professionals with accredited workshops designed to provide non-advocacy, hands-on, interdisciplinary water education materials and instruction. This program trains teachers in use and application of the "Project WET Curriculum and Activity Guide", ground water flow models, Enviroscapes and water history trunks. Contact information for Idaho and Washington's Project WET Programs are located in Section 1. In addition, the Environmental Protection Agency provides many educational resources for kids, families, and educators, here: http://water.epa.gov/ learn/.

Thurston's Groundwater Movement Activity (http://www.epa.gov/ogwdw/kids/pdfs/activity_grades_k-3_groundwatermovement.pdf)

Grades: K-3 (Project WET's activity is suitable for middle school and high school)

Context: Aquifer Atlas pages

Overall Goals: Ground water must be able to move through underground materials at rates fast enough to supply useful amounts of water to wells or sprints in order for those materials to be classified as an aquifer. For water to move in an aquifer, some of the pores and fractures must be connected to each other. Water moves through different materials at different rates, faster through gravel, slower through sand, and even slower through clay. Gravels and sands are possible aquifers; clays usually are not aquifers. The following activity demonstrates how different sizes of rock materials that make up an aquifer affect water movement.

Learning Objectives: After this activity, students will:

Identify several sources of rock materials that make up an aquifer

Discuss how water moves through gravel, sand, and clay

Standards or Curriculum:

Time Required: Preparation time: 30 minutes; Activity time: 20-30 minutes

Materials: at least 10 students, and a large area to conduct the activity. For the "Extended" portion, 250 mL each (a cup or so) of pea gravel, sand, and clay (ground up plain kitty litter), three funnels, cheesecloth, three quart-sized containers or bowls.

Teacher Preparation:

This activity can be conducted in the classroom, gymnasium, or outside the school building. If conducted in the classroom, move all furniture to allow for sufficient room for the movement of students. This is a three-part demonstration that may create some excitement.

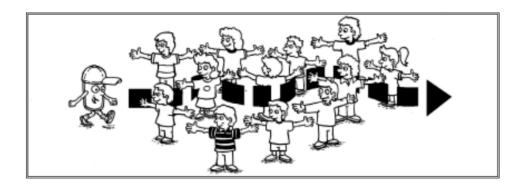

Procedures:

Select two or three students to be molecules of water. The remaining students will be rock materials. Have the students think about and draw or describe what it is like underground, in the aquifer.

Select two or three students to be molecules of water (or, for younger students, "drops" of water). The remaining students will be rock materials.

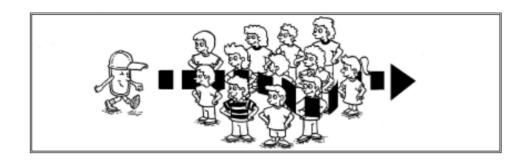

Activity 1: Water movement through gravel

The students will represent gravel by holding arms outstretched, leaving a 15- to 30- centimeter (cm) space between their outstretched arms. Locate these students in the center of the activity area. The students representing water molecules are to start on one side of their "gravel" classmates and move through them, exiting on the other side. The water molecules will move easily through the gravel.

Activity 2: Water movement through sand

The students represent sand by extending arms, bending them at the elbows, and touching their waists with their fingers. Locate these students in the center of the activity area, spacing them approximately 15 cm apart. Once again, have the water molecules slowly make their way through their "sand" classmates. The water molecules will experience some difficulty, but should still reach the other side.

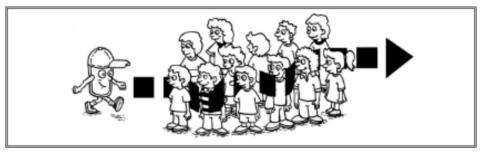

Activity 3: Water movement through clay

Students become clay particles by placing their arms straight down the sides of their bodies and standing approximately 10 cm apart. Locate these students in the center of the activity area. It will be a formidable task for water molecules to move through the clay. The water molecules may not be able to move through the clay at all.

TSWBAT	Create a small water purification	system and demonstrate how it works.	
TSWBAT			
container upon whic	coffee can pre-punched with five to th the coffee can is able to sit.	o ten small holes, sand, muddy water, clean clear	
Activities/procedure	es (include anticipated time for eac	h)	
Introduction/activat Before water can be make a very easy filt	drunk from many sources it needs	s to be filtered to remove contaminants. You can	
Class activities (what	t you/students will do)		
all scientists take no		ell them they will be doing a science experiment and them to write down every step the do in this experi- f interest.	
Have the students p	lace about three inches of sand int	o their coffee cans. (Remind them to make notes)	
Instruct them to set their coffee cans on top of their clean containers. Have the students slowly pour muddy water over the sand.			
As the water filters through, instruct them to watch the water flowing into the clear container underneath the coffee can. What do they notice about this water? Is it cleaner than the muddy water they poured in? Remind the students to make notes of what they are observing.			
If a student's water does not come out cleaner than they started, remind them that in science experiments, sometimes things go wrong. They should make note of what went wrong and try the experiment again. Class activities (why you will do them)			
Closure/reminders Even simple systems can help make our water cleaner!			
Students should hav cleaner than it went thoughts and observ	in. Their notes should show every vations of the process.	ctives - include rubrics) y create their filter. The water should come out y step they took in the experiment as well as their	
Accommodations/differentiation Students can watch the teacher perform the experiment and answer questions about the why they think each step is performed.			

Interpretive Questions:

- cles.)

Extension:

Obtain 250 milliliters (mL) of sand, 250 mL of pea-size gravel, 250 mL of clay (ground-up kitty litter will work), and three large funnels (top diameter approximately 12 cm). Force a piece of cheesecloth onto the top of the spout of each funnel. This will prevent material from going through the funnel spout. Put each funnel into separate clear containers so that the spout of the funnel is at least 5 cm above the bottom of the container. Pour the sand into the first funnel, peasize gravel into the second funnel, and the clay into the third funnel. Pour equal amounts of water (approximately 200 ml, or one cup) onto the materials contained in the funnels. Select three students to pour water, creating a permeability race. Time how long it takes the water to flow through the materials. Record on a data sheet. Which material did the water flow through the fastest? Why?

1. Which one of the materials, gravel, sand, or clay, was the easiest for the water molecules to move through? (Answer, Gravel, then sand, then clay.) Why? (Answer: Because there are larger spaces between the gravel parti-

2. If there were three rock units, one of gravel, one of sand, and one of clay, all containing the same quantity of water, in which would you drill a well? (Answer: Gravel; water moves easier ghrough gravel than sand or clay.)

a story of how wonderful and important water is as a re-That water keeps going around and around and around in e of a few main parts: evaporation (and transpiration from

ties (why you will do them)

o the Mountain and Back will be read to the students. re as follows:

ation: Drippy evaporates. Why? (Answer: the heat of the him to evaporate and become a vapor that goes up and s part of the cloud.

sation: Drippy is now in the cloud and meets another no has also evaporated – Captain Salty. While way up in t is colder and drippy is condensing and turns into water

3. Precipitation: what happens after a while in the cloud? Yes, it starts to bounce and shake. Why? It gets very heavy now that Drippy is water, and all the other raindrops that have accumulated have also turned into water). The air cannot keep Drippy and the other raindrops up there. The cloud bounces and shakes (precipitates) and Drippy and all the water in the clouds come down as rain drops or rainfall. Now sometimes it comes down as rain, or it can be snow, or sleet, or hail; it depends on how cold it is.

Water Cycle: Drippy the Raindrop (Cont.)

1. Collection: Finally, Drippy ends up falling on a stream and then into the river, which carries him back to the ocean. This will happen all over again; this is called collection. It is important to add that some of the rain will fall on the land and soak in and become ground water. This is the water that plants use, and that we get from a well. When water falls back to earth as precipitation, it may fall right back onto the oceans. Or it can fall directly to lakes or rivers. Or, it can fall onto land, where it might soak into the earth and become ground water that plants can drink; or, it can run over the soil to collect in
 water that plants can drink; or, it can run over the soil to collect in the nearest stream or river or lake or ocean to start the cycle all over again.

Closure/reminders

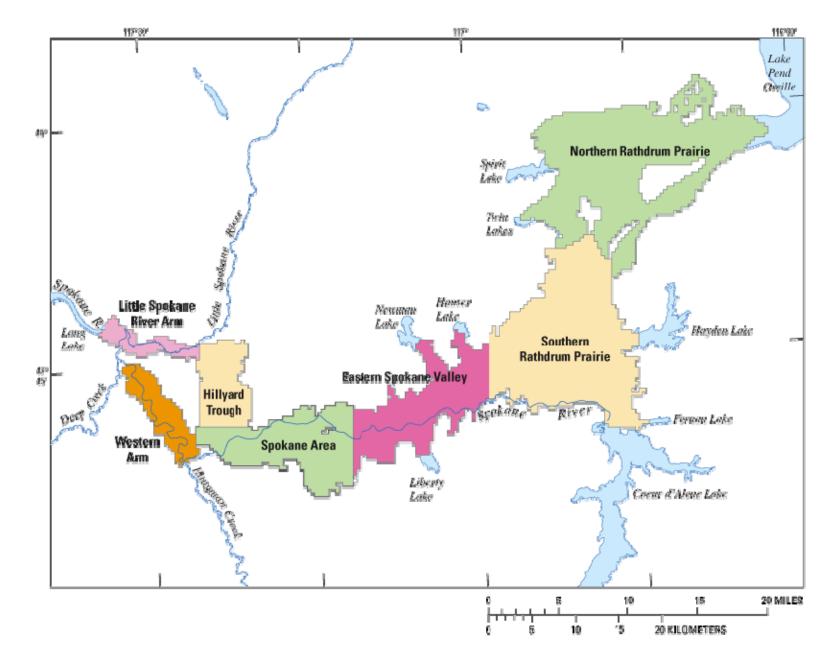

There will be a brief recap of the story.

Assessment (how you will know students met the objectives - include rubrics)

Students will answer questions above to assess how well they understand the water cycle.

Reflection/evaluation (after lesson is taught)

The students will write (with their parents or guardians' help) or draw about the water cycle. This can be signed by parents and brought back to class the next day.

students will do) The students will be tau water song; it is sung to of "The Itsy Bitsy Spider students will sing it alou er:	o the tune r" and the ud togeth-	First, it will be explained to the students that the song is about keeping our water sources healthy by keeping it clean. The students will be asked, "What are some ways that water in our oceans, lakes, and streams gets dirty?" (Answer: pollution, people throwing trash in it, etc.). Then they will be asked, "What can we do to help keep it clean?" (Answer: Throwing trash away, not pouring things out into the gutter or streams, etc.)		
There's water all around us In oceans, lakes and streams. We want it to be healthy, So let's help keep it clean! Water all around us – It helps us grow and live. If we all try not to waste it We'll have some left to give!		It will be pointed out to the students the song is also about trying not to waste water. The students will be asked, "What are some ways that people waste water?" (Answer: leaving the water hose on too llong, leaving the tap on while brushing teeth, etc.) Then they will be asked, "What are some ways that you can help save water?" (Answer: Turning off water while brushing teeth or washing hands, telling a parent about a leaky faucet, etc.)		
Closure/reminders We will sing the water s	song to close	the lesson.		
Assessment (how you will know students met the objectives - include rubrics)				
Our discussion will demonstrate the students' understanding of wasting water and stopping pollution.				
Reflection/evaluation (after lesson is taught) The students will be asked to write or draw in their journal, "What are some ways that people waste wa- ter?" with help from their parent or guardian. Have the parent sign this and return to class the next day.				
The students will be ask	ked to write	or draw in their journal, "What are some ways that people waste wa-

Closure/reminde	ers	
We will make the "W" sound all together before the student goes home.		
Assessment (how you will know students met the objectives - include rubrics)		
The students' work sheets will be evaluated to measure their understanding of the letter W.		measure their understanding of the letter W.

Reflection/evaluation (after lesson is taught)

The student will be asked to talk about the letter W with their parent or guardian. The student will be sent home with a note outlining the day's events, which can be signed by the parent or guardian and returned to school the next day.

I will model the assignment by writing a few senter point of view. I will use the following example: "As the Spokane River, I was scared to see a fish swimr but I went around the fish and stayed in the river." cess of evaporation. (3 minutes)

To spark imaginations, I will prompt students with them on the white board (2 minutes):

Where did the water drop go on its journey What did it see? What adventures did the o How did it feel at different times?

Did the drop meet any plants, animals, or p ter drop help them?

How long did the drop's trip take?

Where does the water drop want to go on i I will encourage the students to use the picture of t the Aquifer Atlas or the placemat to help them as t water drop stories. I will walk around the room to a the students of appropriate grammar, sentence str minutes)

Toward the end of the lesson, I will ask if any stude with the class. As a class, we will briefly discuss the each story. I will then have students turn in their as and review. Students should also look at their Ocea if there are any signs of evaporation, condensation Closure/reminders

After conducting the research, I will ask the students what they believe will happen to their plastic cups of water after a few days. I will remind them that we will check on the plastic cups throughout the week, and they will keep tabs on the project by writing changes they observe down in their journals. I will ask the students their favorite part of the water cycle, and how writing from the water drop's point of view helped them understand more about the water cycle.

Assessment (how you will know students met the objectives - include rubrics) I will be helping students with their experiments and assessing if they are following directions. I will also review the research they conducted to see if they began to understand more about the water cycle.

I will proofread their stories in their writing journals and check to see if they meet the requirements of good grammar, sentence structure, punctuation, and spelling. For the next class, the students will write a final draft for their writing portfolios.

Accommodations/differentiation

For advanced ALP students, extend the lesson by helping students revise and edit their story and encourage them to turn it in to their school literary magazine. The students who finish early may also draw pictures to match their story.

Slower writers should be encouraged to focus on fewer steps in the water cycle (e.g., two instead of three) and focus on better writing.

Activities/procedures (include anticipated time for each)

Introduction/activator

We all know we use water in many ways, but where does that water come from? Is there any new water?				
The answer is that the water is all the same that has ever been, and it goes around in a big cycle.				
Class activities (what you/students will do)	Class activities (why you will do them)			
Show the students the detailed picture of the water cycle on the projector. Explain the stages of the water cycle and get examples from the students of each stage.	Familiarize the students with the water cycle. Give the students a better understanding through walking them through the diagram.			
List the examples on the board. Ask the students questions about what we have gone over.	Help the students to understand and check their un- derstanding.			
Hand out copies of the water cycle picture with blanks as a worksheet. Ask the students to fill in the blanks.	Walk around the room to check to be sure they are on the right track. Students can show me what they have learned.

Closure/reminders All living things are affected by the water cycle. This activity provided us with the opportunity to make a model of the water cycle, whether a diagram or diorama. Models help us to understand and learn more about complex things, or to visualize how different parts work together in a setting that might be too big for us to see all of at once.

Assessment (how you will know students met the objectives - include rubrics) Did the students illustrate major processes of the water cycle correctly? Were key elements incorporated into the model?

Were the students creative in their drawing or use of materials? Was their use of time and supplies efficient?

Did the students demonstrate understanding of the water cycle process through making the model?

	t you/students will do)	Class activities (why you will do them)
Hand out the worksheet on the last page of this plan. Give the students time to look through the pictures. Open the virtual field trip and go through as much as possible in the time allotted.		Use the Virtual Water Conservation Tour to demonstrate water use and conservation principles.
Discuss conservation ideas from the virtual field trip. Ask the class questions about what they have just seen and read. What are some things that we do that use water?		Keep a list of ways we use water on the white board.
Ask, "do you think that some of the water we use gets wasted?Ask about wasting water, and ofWhat are some ways we may be careless about our water use?that means being careless withCan you think of any ways to help reduce the amount of water wethe water that comes out of theuse in a day?cet.		Ask about wasting water, and explain that means being careless with using the water that comes out of the fau- cet.
Get any ideas they have on how to conserve water. Students will write three sentences, one each about how they might use less water at home or school. Students can color the worksheet and can "X" out pictures show- ing careless use of water.		Explain the concept of conservation: that we should be careful about the water that we use, and to try to use less.
Closure/reminders		1

Closure/reminders

We have learned how important water is, and now we have learned how to conserve it. Saving water is a good thing for everyone, so keep this in mind when you are using water at home.

quifer Topic Review Poster

r is something people throughout the region use all the aquifer lessons we have done. Displays are used for peoa topic.

a result of the lesson)

e to demonstrate their knowledge of the aquifer and anion that relates to the aquifer.

e to combine three of their aquifer assignments and creon.

r, and three aquifer assignments.	
clude anticipated time for each)	

ou should all have a good understanding about some to ask each of you a question about the aquifer: answer ion as you can think of. Time: about 15 to 20 minutes. ects, and then use the *Aquifer Atlas* to find the topic and

I worked very hard on all of your aquifer assignments, put them on poster board so that we can display them out your water cycle worksheet (or, use the water cycle Placemat). I also need you to take out the story you napping work, too, where you measured distances. The completed after the aquifer trail/online overhead activity. ers. Provide 20-30 minutes for this assignment.

ass activities (why you will do them)

nis activity is helpful in allowing me to see if the students etained the information from previous lessons about the quifer. If many students struggle with any question, I light need to provide further review.

ne purpose of this activity is to tie everything together nd have it displayed for the class and the school. They will e able to look over their work and continue to learn about ne aquifer by seeing what others display.

ing, and we rely on it every day. It is good to know someer our feet. We have created a poster about all that you

objectives - include rubrics) ion that relates to the aquifer. The student will have creirned.

Name: Kristin Wanner		
Subject: Writing, speaking, and listening		Water Use and Conservation
The big idea(s) or essential question(s): Water us used throughout the world for many things. But there isn't much fresh water around, so we should conserve it.		
Core standards addressed: CCSS: 2.W.8; 2.SL.2		
Objectives (what	at the students will be able to do as a result of the	e lesson)
TSWBAT	The student will be able to use their knowledge ways they use the water from the aquifer.	of the aquifer and provide at least two
TSWBAT		
Materials and/or technology <i>The Spokane Valley-Rathdrum Aquifer Atlas</i> pg. 16. SAJB Elementary Water Conservation education site: <u>http://www.spokaneaquifer.org/education-awareness/elementary-water-conservation/</u> . White board, markers., Paper and pencil.		
Activities/procedures (include anticipated time for each)		
Introduction/activator: Today we are going to learn some ways that each of our classmates uses the aqui- fer. I am going to call on you and you need to tell me two ways that you use the aquifer. Then I want you to write down the answers I put on the board so you can have them for later. This portion should require about 15 minutes.		

To learn about why it is important to conserve water, we will go through an online water conservation trail, and you will see why it is important to use less water. You will think about all the ways we might be a little careless about water use. Then we will list them out on the board, and you will copy the list so that you can have them for later. This portion should take about 20 minutes.

have them for facen this portion should take about 20 millatest	
Class activities (what you/students will do)	Class activities (why you will do them)
Students will be called upon to give an example of how they use water. Start with their use this morning (e.g., brushing teeth, or drinking). Then expand into other household uses. Write the responses on the board, but also have the students write them down so that they can use the list later.	The point of this activity is for the stu- dents to get an understanding of the many different ways we use the water in the aquifer every day. By having the stu- dents write down the different ways we use the aquifer, it allows them to see how
Students should be asked individually to provide input as we progress through the water trail.	important the aquifer is to us. Then the students will see that there are many different ways we can conserve water.
The students will make a list on their paper of different ways they can conserve water at home. I will walk around the room providing assistance to those who need it. I will have each of them tell me one of the things they listed, and then write it on	Note that California is in a long term drought, and that there is very little water to go around.
the board. Once we have completed a list on the board, the students will write down anything they had not written on their paper before.	Then, start the water conservation trail activity by accessing the online trail at the URL provided above. Go through as much of this as possible in the time allotted.

Closure/reminders: Now that we know how we use water and how we can use a little less, keep these lists with you and think about other ways that water is used, and sometimes wasted.

Assessment (how you will know students met the objectives - include rubrics) Students will have handed in a list of ways they use water and ways they can conserve. Be sure that spelling is correct, and that a complete list of each is provided.

What symbols do you see on the example map and the legend of Barefoot Island?	
You are going to create your own legend and map. Its name is barefoot Island and you get to decide what goes on your island.	
Have a few students bring their map and leg- ends up to put on the overhead as examples.	

Closure/reminders: Maps are a great way to learn about an area and become familiar with where everything is located. Maps can help us plan a trip by telling us what the area is like.

Assessment (how you will know students met the objectives - include rubrics) Did the students use a minimum of five symbols and the required features on a map? Completed handout with at least three of four answers right. Reflection/evaluation (after lesson is taught): Find other maps that the students might be familiar with. For instance, maps of the school, or the town.

Name: Kristin Wanner Subject: Reading The big idea(s) or essential question(s) Everyone uses words, but to use them, you need to know what they mean and how to spell them properly. Core standards addressed: CCSS: 1.RI.4 Objectives (what the students will be able to do as a result of the lesson) The students will be able to spell at least 10 vocabulary words from the Aquifer Atlas **TSWBAT** Glossary, and will be able to determine the meaning of them. Materials and/or technology The Spokane Valley-Rathdrum Aquifer Atlas pgs. 26 and 27. Pencil and paper. Activities/procedures (include anticipated time for each) Introduction/activator I hope everyone has been studying for their spelling test. For the test, I am going to tell you the word and then I will also give it to you in a sentence. If you are having a hard time remembering how to spell a word, be sure to try your best and sound it out. Please take everything off your desk except for a pencil and paper. This portion should take 10 minutes. Now that we have taken a spelling test, I want you do demonstrate that you know what these words mean. Write the definition of each of the words you wrote down during the spelling test; if you need more space,

re-write some of them on the back of the sheet, or on another piece of paper. If you are having trouble with one, skip it and do the ones you know, and that way, you can get all the ones you do know down, and can work on those you are less sure of at the end of the exercise. This should take about 20 minutes. Class activities (what you/students will do)

I will give the students a word and use it in a senter should write the word down on their paper, leaving writing a definition later.

Once the spelling test is completed, the students w down the definitions of the words.

Take out the Aquifer Atlases and try to find all ten helps you to edit your definitions to make them be ahead and edit them.

Closure/reminders: Put your name on your paper and pass it to me. I will grade them and return them to you. Keep them so that if you ever are having trouble remembering what a word means, you can look back at your work.

Assessment (how you will know students met the objectives - include rubrics) I will know the students have met the objectives because they will have turned in completed work. This means they will have written the vocabulary words and their definitions.

Spelling and Vocabulary

The big idea(s) or essential question(s): Dif		I fferent points on a map or atlas are represented in a way that
people can locate the real p	points on the gr	ound.
Core standards addressed: CCSS: 2.RI.7		
Objectives (what the stude	nts will be able	to do as a result of the lesson)
TSWBAT The s	tudent will be a	able to locate Mt. Spokane (or other familiar points on a map).
Materials and/or technolog		
The Spokane Valley-Rathdr		
А	ctivities/proced	dures (include anticipated time for each)
Introduction/activator		
	g about maps. N	Ne will be learning how to read a map, how to use a compass, and
how to measure different d	listances. For th	nis lesson, we are going to learn how to locate Mt. Spokane on a
map in the Aquifer Atlas. (T	Time allotted is	about fifteen minutes for this whole exercise: Introduction for 5-
minutes; 5-minutes to dem	onstrate some	familiar places on the map; 5-minutes for students to locate Mt.
